

HW11

I found there was some problem in my code of my knapsackDP. Because I tried different problem the HW10 gave, it was fine. But in this time, it occurred it can find some data in the list. I found because the data was beyond the 16 bit. So I correct my code. I add the **round** function.

```
ValueError: 0.29000000000000004 is not in list
```

```
result.append(opt_m[h][current_m])  
remaining_value = round(remaining_value - V[h]*opt_m[h][current_m],2)
```
